

# camel

## FEATURES

- Camels are mammals with long legs, a big-lipped snout and a humped back
- There are two types of camels: dromedary camels, which have one hump, and Bactrian camels, which have two humps
- Camel has long eyelashes that protect them from dust
- Large hump that stores water and food in harsh desert conditions
- A fully-grown camel can weigh up to 700kg/ 1542lbs

## FEATURES

- A chicken has two legs, two wings, two eyes, a beak, and a crest on its forehead.
- Chickens cannot fly unevenly like other birds, they can only fly at low altitudes for a very short time. The whole body of the chicken is covered with small feathers.
- Male bird is called a rooster and a female is called a hen.
- Hens sit on their eggs and incubate them, and after a few days, the chicks emerge from these eggs.
- In addition to eggs, a hen is also a source of meat. Like eggs, meat is also consumed by humans across the world. It is because of hens that India is able to meet the demands of the growing population.

# HORSE

## FEATURES

- Horses have oval-shaped hooves, long tails, short hair, long slender legs, muscular and deep torso build, long thick necks, and large elongated heads
- The teeth are specialized for grazing, with cheekteeth that are complex and grow continually
- Size can vary depending on the breed, but can range from 227 to 900 kg in mass and 0.9 to 1.7 meters in height.
- Male horses herd females during the mating season and defend them against other males, who may be trying to mate with the females
- Horses are sensitive and emotional animals, capable of forming deep loving bonds with humans
